

## Rich Internet Applications

Rich Internet applications (RIA) are web applications that have the features and functionality of traditional desktop applications. RIAs typically transfer the processing necessary for the user interface to the web client but keep the bulk of the data (i.e., maintaining the state of the program, the data, etc.) back on the application server. RIAs typically provide a "no-refresh" look to the user interface and provide what is now being known as HDuX - High definition User eXperience. We create dynamic, database-driven Rich Internet applications for clients worldwide. We utilize our expertise with technological skills to create powerful portfolio of rich, intuitive web applications providing second-generation user experiences. RIAs are the wave of the future for business application development. According to Gartner, atleast 60% of the new application development will include RIA application by 2010.
